

FrostieStack White Paper v1.0

1. Abstract

The digital publishing landscape is fragmented, centralized, and structurally opaque. Content creators, developers, and decentralized communities alike face significant limitations—from fragile monetization models to siloed infrastructure and unverifiable governance processes. While the internet has enabled global communication, the core platforms that mediate publishing remain closed, permissioned, and increasingly extractive.

FrostieStack, built in deeply integrated with the Walrus Protocol, introduces a decentralized publishing protocol that leverages Walrus's decentralized blob storage, content delivery, and licensing framework to restore ownership, transparency, and modularity to the publishing process. that restores ownership, transparency, and modularity to the publishing process. Built on the Sui blockchain and powered by smart contracts, FrostieStack enables creators to author, version, and monetize content with full sovereignty. By integrating Walrus's programmable content hosting and schema enforcement layer, FrostieStack provides developers with blueprint-based tooling, lifecycle management, and persistent publishing endpoints—enabling the construction of interoperable content primitives without rebuilding backend systems. to construct interoperable content primitives—ranging from blogs and proposals to collaborative documents—without rebuilding access logic or backend infrastructure from scratch.

Every action in FrostieStack is cryptographically verifiable. Authorship is tied to wallet identity, permissions are enforced on-chain, and content evolves through traceable, auditable updates. This unlocks a new publishing model where DAOs, teams, and individual creators can build transparent knowledge systems, govern collaboratively, and participate in programmable content economies.

By fusing content creation with decentralized infrastructure, FrostieStack realigns the incentives of creators, developers, and users. It empowers sovereign publishing in a world increasingly dominated by centralized algorithms, walled platforms, and disposable content.

FrostieStack is not just a tool—it is foundational infrastructure for the future of open, composable knowledge.

2. Vision & Mission

Vision: To empower developers and content creators with full ownership, transparency, and control of digital content through a decentralized content infrastructure that redefines the future of publishing.

Mission: FrostieStack aims to become the foundational layer for Web3 content collaboration, enabling developers to build composable, secure, and interoperable publishing systems, and empowering creators to manage, monetize, and protect their content autonomously.

In pursuit of this mission, FrostieStack provides an open-source toolkit for building CMS experiences on top of verifiable and modular infrastructure. By decoupling content logic from centralized servers, it brings composability, sovereignty, and decentralization to publishing at scale.

3. Problem Statement

While digital publishing has undergone radical change in the Web2 era, it continues to rely heavily on centralized infrastructure, closed platforms, and opaque control over content and user data. FrostieStack identifies several structural shortcomings that limit sovereignty, composability, and long-term sustainability across content ecosystems.

3.1 Creator & Publisher Limitations

In most modern CMS and content platforms:

- **Ownership is Obscured:** Content is hosted on third-party servers, governed by ToS that can change without warning. This exposes creators to deplatforming, data loss, or restricted access.
- **Monetization is Fragmented:** Revenue streams depend on platform-specific models—subscriptions, ad networks, or gated APIs—that are rarely interoperable or portable.
- **Interoperability is Absent:** Content is locked into proprietary schemas and formats, making cross-platform reuse and collaboration extremely difficult.

These limitations reduce creator agency, hinder open innovation, and centralize value capture in the hands of platform operators.

3.2 Developer Challenges

Building modern publishing platforms poses serious friction for developers:

- **Lack of Standardization:** Developers must reinvent schemas, permissions, and editorial logic for each new project, leading to duplicated effort.
- **On-Chain Integration is Hard:** Most CMS tools are incompatible with blockchain-native workflows. Building from scratch with smart contracts, wallets, and decentralized storage is costly and complex.
- **No Composability Layer:** There is no shared protocol for reusing publishing components across apps or DAOs. Developers are siloed into monolithic implementations or locked into SaaS APIs.

As a result, the potential for open-source, community-owned publishing infrastructure remains untapped.

3.3 Ecosystem Constraints

Despite the rise of Web3-native tooling, content creation remains fragmented:

- **DAOs & Collectives Lack Infrastructure:** While DAOs flourish in governance and finance, they lack tools for transparent, traceable content production and documentation.
- **Tokenization is Underutilized:** Most content platforms don't support tipping, licensing, or royalties at the protocol level. Creators can't benefit from programmable economics.
- **Versioning & Governance Are Manual:** Content governance relies on informal norms or web2 tools, which lack verifiability and collective oversight.

The Web3 ecosystem needs publishing tools that are decentralized by design—tools that empower contributors, reward collaboration, and preserve history immutably.

FrostieStack addresses these core challenges by offering a blueprint-driven, smart-contract-governed, and fully composable publishing protocol that serves as the foundational layer for sovereign content ecosystems.

4. Solution Overview

FrostieStack bridges the gap between decentralized technologies and modern publishing needs by offering a composable, user-friendly platform. It resolves longstanding issues around ownership, access control, and content portability through a system of smart contracts, modular blueprints, and interoperable tools.

4.1 Verifiable Content Ownership

At the heart of FrostieStack is the principle of self-sovereign publishing. Every piece of content—from blog posts to governance proposals—is:

- **Stored Decentrally:** Leveraging Walrus Blob and IPFS-like systems.
- **Versioned On-Chain:** Each update is tracked with cryptographic checkpoints.
- **Owned by Authors:** Wallet-authenticated authorship and cryptographic signatures ensure that only original creators can modify or transfer content.

This model removes dependency on centralized platforms and restores full agency to the content originator.

4.2 Developer-Centric Infrastructure

FrostieStack makes blockchain-native publishing approachable with a stack built for developers:

- **Blueprint SDK:** Offers customizable templates and schema libraries for rapid setup of publishing flows.

- **Smart Contract Modules:** Pre-built RBAC and metadata registries reduce development time and increase auditability.
- **API & CLI Interfaces:** Developers can build, test, and deploy apps using familiar tooling without needing deep blockchain expertise.

With built-in version control, schema governance, and content lifecycle APIs, FrostieStack minimizes backend overhead while maximizing extensibility.

4.3 Seamless Publishing Experience

FrostieStack abstracts the complexity of Web3 for end users:

- **Wallet-Based Permissions:** No login/passwords; role-based access control is tied to wallet identity.
- **Gasless UX (Future):** Optional gas delegation allows creators or DAOs to subsidize transactions for contributors.
- **UI-Integrated Tooling:** Admin dashboards, live editors, and moderation queues are all web-native, ensuring low friction for non-technical users.

This enables communities, creators, and teams to focus on content—not the underlying infrastructure.

4.4 Interoperable and Secure Ecosystem

FrostieStack supports a multi-token model (e.g., \$FROSTIE, \$SUI, \$WAL, \$USDC) and integrates with:

- **Walrus Protocol:** For decentralized hosting, version pinning, and blueprint licensing.
- **Sui Blockchain:** Leveraging Move for robust smart contract security and scalability.
- **Extensible Engine:** FrostieStack is designed as a modular content infrastructure engine, enabling the creation of CMS-based products such as FrostieBlogs and FrostieNotion. Developers can define reusable publishing blueprints, while Frostie Labs and others can build domain-specific applications that plug directly into the protocol's schema, storage, and permission layers.

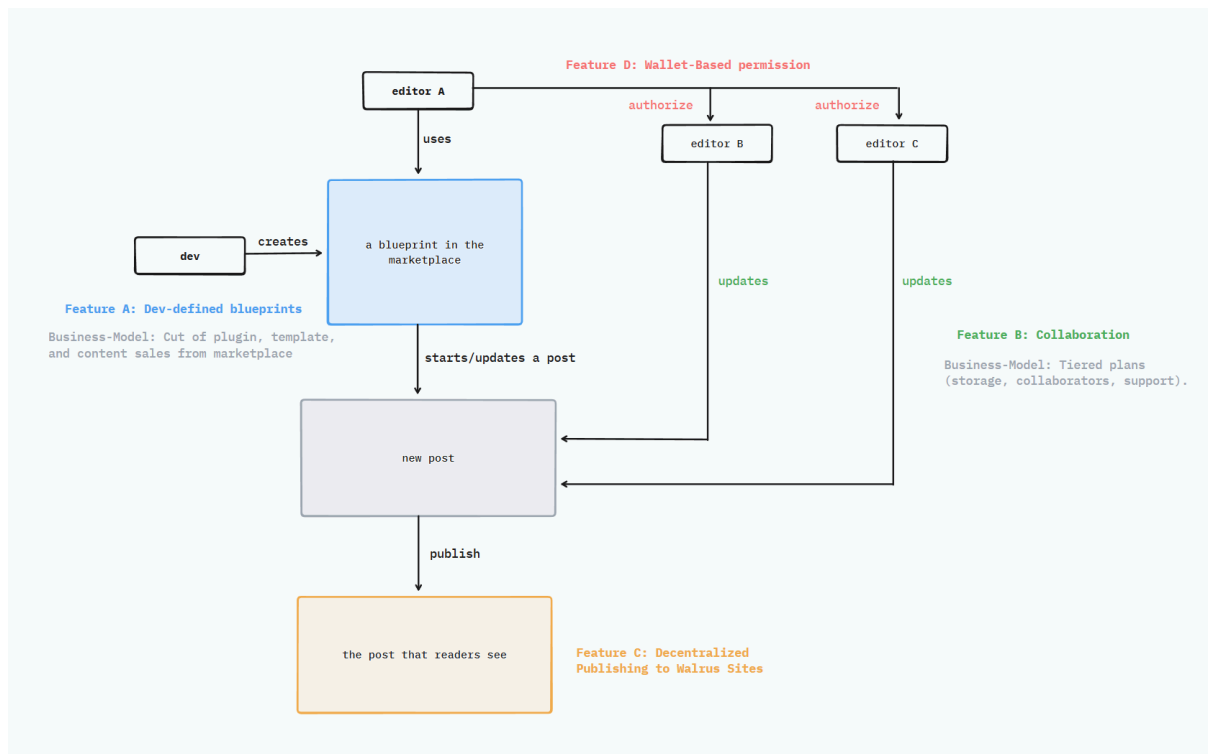

The platform incorporates industry-standard security practices, including on-chain audit trails, signature verification, and permission scoping, ensuring content and contributors are protected across the lifecycle.

Together, these components form a decentralized, extensible solution for digital publishing—empowering both creators and developers to build sovereign, collaborative, and future-proof content ecosystems.

5. Ecosystem & Use Cases

FrostieStack is not just a protocol—it's an evolving ecosystem designed to serve developers, creators, and organizations building the next generation of decentralized publishing tools.

This section outlines the key drivers of ecosystem growth and practical use cases that highlight how FrostieStack facilitates real-world adoption.

5.1 Ecosystem Expansion Through Modular Products

FrostieStack’s roadmap includes onboarding a diverse suite of modular publishing products such as FrostieBlogs, FrostieNotion, and FrostieProposals. These offerings target specific verticals—creators, DAOs, startups—while sharing a common infrastructure of content blueprints, RBAC, and decentralized hosting.

Drawing inspiration from platforms like WordPress and Notion, FrostieStack believes that achieving critical mass across multiple composable applications will accelerate network effects. Once dozens of decentralized publishing spaces go live, the shared infrastructure will unlock:

- **Content Portability:** Users can carry identity and content schemas across apps.
- **Inter-app Integrations:** Blueprints and plugins created for one product (e.g., FrostieNotion) can be reused in another (e.g., FrostieDocs).
- **Shared User Pools:** Communities formed around one product can engage and contribute to others, fueling ecosystem-wide engagement.

5.2 Blueprint Marketplace and Developer Network

FrostieStack is built for extensibility. Developers can:

- Publish and license custom blueprints, templates, and components.
- Monetize content logic via subscriptions or per-use pricing.
- Collaborate through a registry of open-source publishing modules.

This enables an organic developer ecosystem where high-quality schema logic and publishing flows become reusable assets, akin to npm packages or app themes. FrostieStack's blueprint marketplace becomes a decentralized app store for publishing infrastructure.

5.3 Creator-Centric Publishing & Monetization

FrostieStack redefines the creator economy by aligning incentives with sovereignty:

- **Own Your Work:** All content is verifiably authored and stored through decentralized protocols.
- **Monetize Creatively:** Native tipping, gated publishing, and licensing allow creators to generate sustainable income.
- **Build in Public:** Projects and DAOs can use publishing primitives to co-author proposals, documentation, or manifestos that are both human-readable and machine-verifiable.

FrostieBlogs will provide a launching point for this vision—offering a fully decentralized blogging platform where every post, edit, and comment is governed on-chain.

5.4 Collaborative Workflows for DAOs & Teams

FrostieStack addresses the growing demand for decentralized collaboration platforms. In FrostieNotion and FrostieProposals:

- Smart-contract RBAC governs editing rights without centralized admin roles.
- Version control is enforced through chain-verifiable publishing checkpoints.
- DAO members can co-edit and sign content with their wallet identities, ensuring traceability and transparency.

These tools serve as primitives for DAO governance, transparent knowledge bases, and collective publishing initiatives.

5.5 Expansion Beyond Publishing

The architectural flexibility of FrostieStack supports applications beyond traditional publishing:

- **Education:** Online learning communities can build LMS platforms using blueprints.
- **Research:** Collaborative research papers and reproducible data experiments can be authored and shared.
- **Art & Culture:** Decentralized zines, poetry collectives, and digital art journals gain permanence and composability.

As metaverse platforms and creator collectives emerge, FrostieStack's schema-first, blueprint-driven model positions it to serve as foundational infrastructure for any form of digital expression that values transparency, ownership, and collaboration.

FrostieStack will integrate the FROSTIE token as the native utility and governance token for its ecosystem. In addition to the FROSTIE token, the platform also supports Sui-based

payments and integration with the Walrus protocol for decentralized storage and content hosting. These interoperable components provide a robust and flexible token and data infrastructure that supports real-world monetization, enterprise use, and open ecosystem participation.

6. Token Economy

FrostieStack integrates the \$FROSTIE token as the native utility, incentive, and governance asset of the ecosystem. This token unlocks a multi-dimensional economic layer supporting creators, developers, and stakeholders in a modular publishing environment. Alongside \$FROSTIE, the protocol also supports Sui-based payments (\$SUI, \$WAL, \$USDC), and integrates with Walrus for decentralized content hosting and licensing.

By combining a utility token with a stablecoin gateway, FrostieStack balances experimentation with reliability—enabling creative monetization, platform sustainability, and community-led governance.

6.1 FROSTIE Token Utility

\$FROSTIE powers core interactions within the platform across several domains:

- **Creator Monetization:** Unlock gated content, accept tips, and launch subscription models directly from publishing interfaces.
- **Blueprint Economy:** Developers can tokenize and license modular publishing blueprints, templates, and UI packs for \$FROSTIE.
- **Community Contribution Rewards:** Moderators, curators, translators, and content reviewers earn token incentives for their roles in ecosystem quality and governance.
- **Protocol Services:** Pay for advanced publishing tools, NFT-based content verification, and future AI-based enhancements (e.g., AI-assisted authorship).
- **Publishing Credits & Discounts:** Users holding \$FROSTIE may receive priority access, discounted services, or early beta features.

By embedding utility at every stage—from publishing to protocol governance—FROSTIE aligns economic incentives across stakeholders and fosters a thriving creator economy.

6.2 Governance Model

\$FROSTIE token holders will gradually gain rights to influence protocol direction and upgrades via a transparent governance process. As FrostieStack transitions toward decentralized governance, community members will be able to:

- Submit and vote on proposals for new features, integrations, or core parameter changes.
- Influence how treasury grants are distributed to projects, developers, and ecosystem builders.
- Shape ecosystem priorities by allocating funding or determining product roadmaps.

FrostieStack's governance will initially be guided by the Frostie Foundation and shift over time into a decentralized autonomous organization (DAO) governed by the community of token holders.

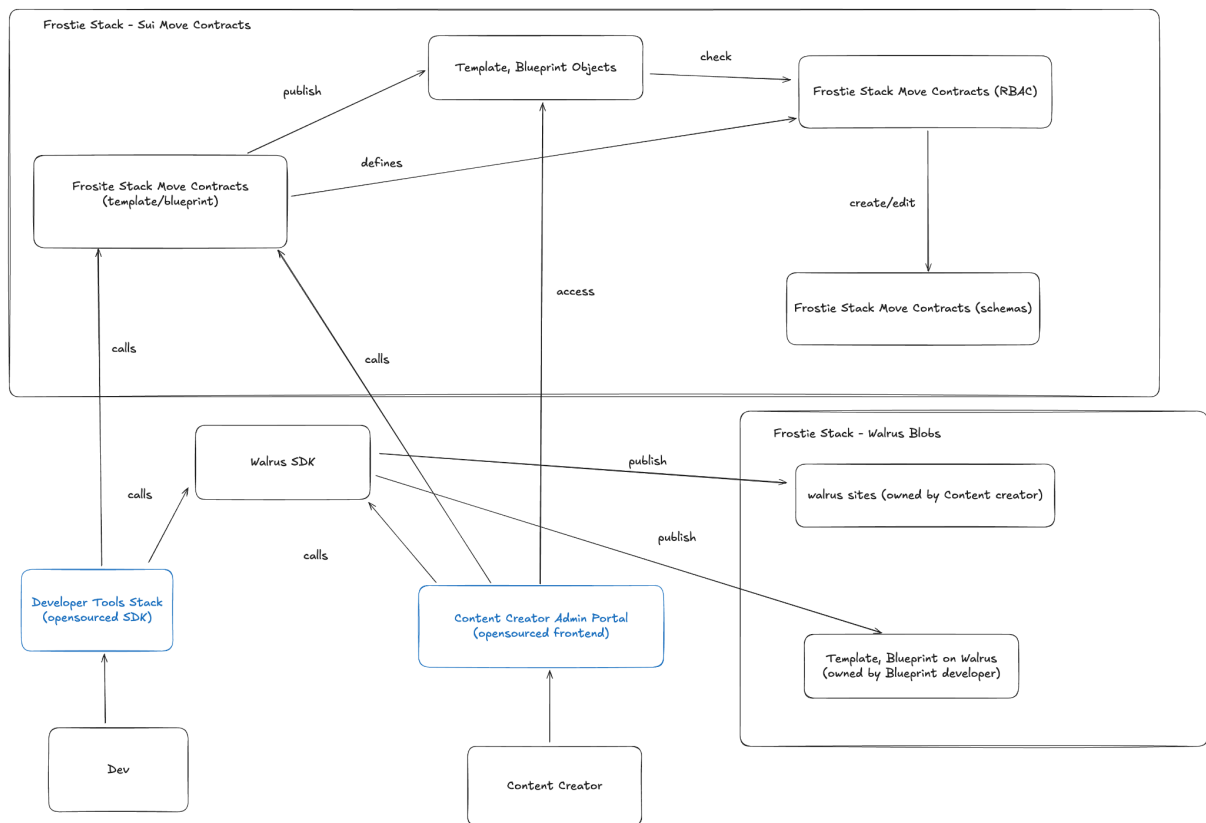

6.3 Interoperability & Multi-Asset Support

- **Partner Integrations:** \$FROSTIE will be compatible with third-party publishing tools, design asset marketplaces, and education platforms—expanding its scope as a utility token.
- **Sui based Payments:** For predictable costs, \$SUI, \$WAL, \$USDC is accepted for access to premium services, DAO proposal publishing, or institutional use cases.
- **Walrus-Powered Infrastructure:** \$FROSTIE, \$SUI, \$WAL, \$USDC are accepted as payment for Walrus-hosted decentralized sites, ensuring that content delivery and licensing operate without central control.

The combination of programmable incentives, real-world utility, and cross-platform compatibility positions \$FROSTIE to serve not only FrostieStack, but also the wider Web3 publishing stack.

7. Technology and Features

FrostieStack is architected for composability, high-performance collaboration, and on-chain verifiability. Its infrastructure draws inspiration from both modern cloud-native design and blockchain scalability patterns, enabling a secure and extensible publishing experience.

7.1 Decentralized Architecture

FrostieStack is built on the Sui blockchain using Move smart contracts. The protocol ensures that publishing logic, access control, and versioning are all on-chain and verifiable. Key highlights:

- **Smart Contracts:** Govern blueprint schemas, user permissions, and publishing checkpoints.
- **Authentication Layer:** Utilizes Slush Wallet for zero-knowledge login and wallet-based access control.
- **RBAC Engine:** Smart contracts enforce roles like Admin, Editor, and Viewer with cryptographic guarantees.

7.2 Modular Web Stack

FrostieStack's architecture leverages a hybrid Web3 stack:

- **Frontend:** Built using React, Vue, and component frameworks like DecapCMS.
- **Backend:** Utilizes static site generators (Hugo, mdBook) combined with Kubernetes-native deployment flows (Knative, ArgoCD).
- **Middleware:** Rust and Go microservices power real-time recommendations, NFT utilities, and webhook relays.
- **Storage:** Walrus Blob for decentralized content storage; ScyllaDB and ClickHouse for analytics and comments.

This modular design enables plug-and-play integrations, localized deployments, and low-latency user experiences across edge environments.

7.3 Real-Time Collaboration Engine

FrostieStack supports advanced collaborative workflows:

- **NATS Protocol:** An event-driven messaging bus powers live editing, preview rendering, and engagement signals.
- **Streaming Edits:** Future enhancements will enable multiplayer-style editing with cursor presence, chat, and inline annotations.

These systems lay the groundwork for DAO-wide knowledge bases and co-authored content primitives.

7.4 Decentralized Site Generation

Inspired by blockchain validator models, FrostieStack will support:

- **Distributed Rendering Nodes:** Token-incentivized nodes that verify blueprints and render static content.
- **Checkpointing:** State snapshots and content hash confirmations for auditability and rollback.

This system enables censorship-resistant publishing at global scale, eliminating reliance on centralized build servers.

7.5 Interoperability and Extensibility

FrostieStack is engineered to be chain-agnostic and protocol-composable:

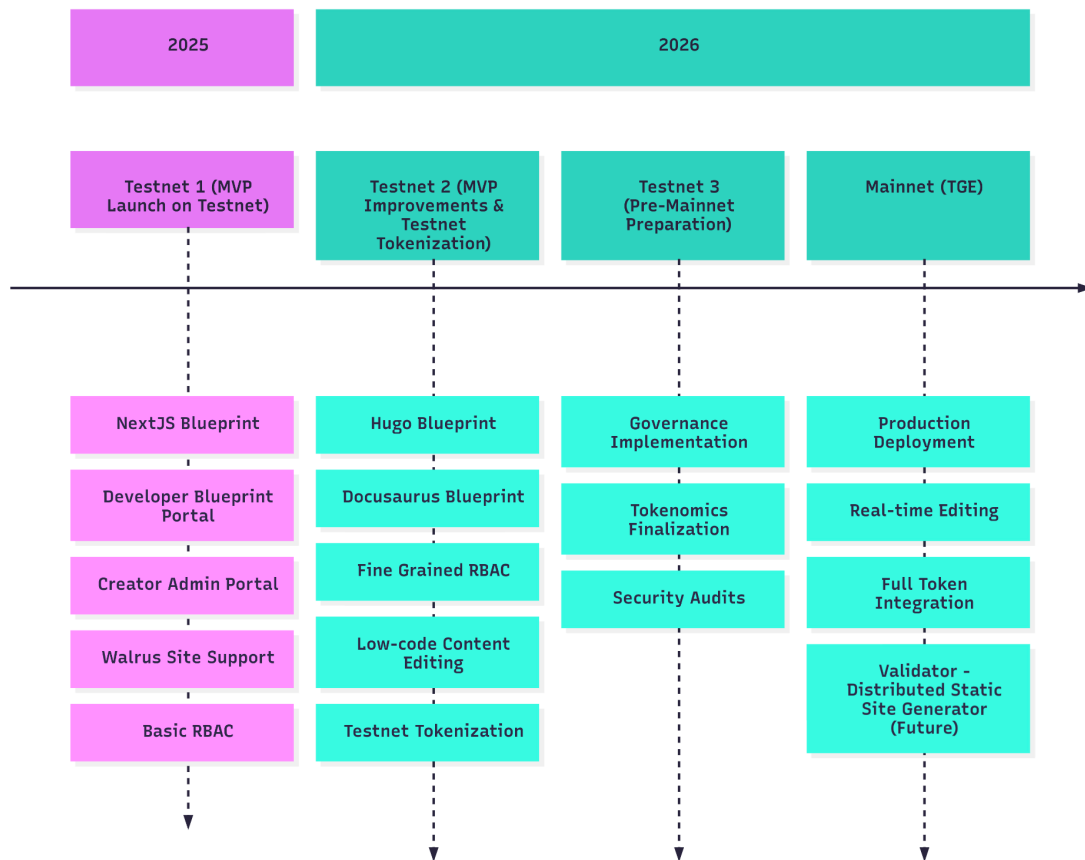

- **Multi-token Support:** \$FROSTIE, \$SUI, \$WAL, USDC are used for content monetization, DAO voting, and blueprint licensing.
- **Walrus Integration:** Enables decentralized hosting, persistent content delivery, and customizable publishing endpoints.
- **Future Bridges:** Will connect with other L1s or L2s for cross-chain publishing access and asset portability.

By integrating blockchain-native primitives with a composable publishing layer, FrostieStack offers a resilient, upgradeable, and community-owned publishing platform for the next generation of creators and developers.

8. Roadmap

FrostieStack's development roadmap is structured into three distinct phases: short-term, mid-term, and long-term. Each phase focuses on key deliverables and progressive ecosystem expansion, aligning with the goal of establishing FrostieStack as a foundational Web3 publishing infrastructure.

FrostieStack Development Roadmap

Short-Term Goals

- Launch the Minimum Viable Product (MVP), including the Frostie CLI for blueprint creation and the Admin Portal for content editing.
- Enable blueprint deployment to Walrus Sites with integrated wallet-based authentication.
- Enforce role-based access control via smart contracts.

These milestones establish the foundational workflow between developers and creators, proving the blueprint-based publishing model and decentralized storage integration.

Mid-Term Goals

- Expand the feature set to include smart contract-governed version control and private content visibility.
- Upgrade the Admin Portal with a Notion-style live editor and advanced UI features for schema editing.
- Introduce monetization options, including token-gated content, subscriptions, and premium blueprint licensing.

This phase enhances user collaboration and enables new economic models for both developers and creators. It also lays the groundwork for community scaling.

Long-Term Goals

- **Launch FROSTIE token (TGE) and implement DAO-based governance mechanisms.**
- **Introduce AI-powered content recommendation engines and real-time co-editing workflows.**
- **Release flagship products like FrostieBlogs and FrostieNotion.**
- **Begin development of distributed site generation network, using a validator-like model for decentralized content rendering.**

These goals will help establish FrostieStack as a robust, modular, and self-sustaining publishing ecosystem with deep community engagement and a future-proof architecture.

9. Frostie Foundation

9.1 Overview

The Frostie Foundation is an independent initiative formed to support the long-term development, adoption, and decentralization of the FrostieStack protocol. The Foundation operates under a public-interest mandate, prioritizing open infrastructure, creator empowerment, and decentralized governance over profit motives. It provides a neutral and sustainable organizational base for global collaboration.

FrostieStack's mission to reshape the digital publishing landscape requires more than software—it requires stewardship. The Foundation is committed to building trust, transparency, and inclusivity into the ecosystem from the ground up.

9.2 Foundation Activities

The Frostie Foundation supports the core research and engineering required to maintain and evolve the FrostieStack platform. This includes funding open-source development, conducting smart contract audits, and supporting improvements to infrastructure scalability and security.

It also plays a vital role in community and ecosystem growth:

- Offering grants, resources, and documentation to developers building on FrostieStack.
- Hosting community-driven events such as hackathons, blueprint showcases, and educational workshops.
- Engaging with industry partners and academic institutions to expand protocol visibility and usage.

To ensure accountability, the Foundation embraces open governance principles:

- Regular transparency reports and financial disclosures.
- Open voting mechanisms for major decisions.
- Channels for stakeholder feedback and contributor recognition.

As FrostieStack matures into a DAO-governed ecosystem, the Foundation will evolve its role to focus on coordination, advocacy, and long-term protocol health. ** UI/UX Design & Brand Systems.

10. Risk Factors

Engaging with the FrostieStack ecosystem involves inherent risks associated with emerging blockchain technologies, market conditions, and regulatory environments. While Frostie Labs strives to minimize these risks through rigorous design, testing, and governance, users and contributors should be aware of the following key considerations:

10.1 Technical Risks

As a decentralized infrastructure, FrostieStack relies on complex smart contracts, cryptographic systems, and third-party tools. Potential vulnerabilities—such as contract bugs, integration failures, or downtime in decentralized storage networks—could cause data access issues or content disruptions. System upgrades and protocol changes may also introduce temporary instability or migration risks.

10.2 Market Volatility & Liquidity

The FROSTIE token, while designed for utility and governance, may be subject to significant price fluctuations due to broader crypto market volatility. These changes can impact user behavior, platform adoption, and the perceived value of ecosystem contributions. Liquidity constraints or shifts in token demand may reduce economic incentives for developers or creators.

10.3 Regulatory & Legal Uncertainty

The regulatory landscape for decentralized content platforms and utility tokens is still evolving. Jurisdictions may introduce policies that affect platform operations, restrict token utility, or impose compliance requirements on creators and developers. Such developments could limit access to FrostieStack services or require architectural adjustments.

10.4 Operational & Governance Risks

FrostieStack is in active development and operates with evolving governance. Misalignment among stakeholders, delays in feature rollouts, or low participation in governance processes may introduce operational inefficiencies or reduce platform responsiveness. Transitioning to DAO governance will require careful balancing of transparency, accountability, and agility.

10.5 Competition & Technological Shifts

New Web3 CMS platforms or innovations in content delivery may reduce FrostieStack's competitive advantage. As blockchain tooling matures, alternative ecosystems with different scalability, privacy, or UX features may emerge and compete for developer attention and user trust.

10.6 Force Majeure & External Disruptions

Events outside of FrostieStack's control—such as natural disasters, major cyberattacks, global market shocks, or geopolitical events—may affect development timelines, access to infrastructure, or user activity. Participants should understand that decentralized systems, while resilient, are not immune to broader real-world disruptions.

In addition to the above, unforeseen or unanticipated risks may emerge as the ecosystem evolves. All participants are encouraged to perform their own due diligence and consider these factors carefully before engaging with FrostieStack.

11. Legal Disclaimer

11.1 Purpose of Information

The content of this white paper is provided for general informational purposes only. It is not intended to be comprehensive or constitute legal, financial, investment, or tax advice. Readers should consult professional advisors for specific guidance and assume full responsibility for decisions based on this document.

11.2 Investment and Transaction Risks

Engaging with blockchain-based platforms, including the use of FROSTIE tokens or participation in FrostieStack features, involves inherent risks such as regulatory changes, market volatility, and technical challenges. Users should fully understand these risks before making transactions or engaging in platform-related activities.

11.3 Legal and Regulatory Status

The legal classification of utility tokens, including FROSTIE, varies by jurisdiction and may be subject to evolving regulations related to securities, anti-money laundering (AML), and consumer protection. As such, access to and use of FrostieStack may be restricted or adjusted in certain regions to comply with local laws.

11.4 No Guarantee of Legality

This white paper does not guarantee that FROSTIE tokens or platform features will be legally permitted in all jurisdictions. Certain aspects of the ecosystem may be deemed restricted or require compliance measures depending on regulatory interpretation.

11.5 Limitation of Liability

Frostie Labs and affiliated contributors make no representations or warranties regarding the accuracy, completeness, or timeliness of the information provided in this document. No liability is accepted for losses or damages incurred as a result of using this information or participating in the ecosystem.

11.6 Forward-Looking Statements

This white paper contains forward-looking statements, including future plans, features, and anticipated milestones. These projections are based on current assumptions and estimates. Actual results may differ due to a variety of risks, uncertainties, and evolving circumstances including market shifts, technological developments, and regulatory updates.

FrostieStack is a sovereign publishing protocol built by Frostie Labs. Together, we can decentralize content, reimagine CMS infrastructure, and return creative power to the community.
